EXPERIMENT 5

Building Reports, Dashboards and Custom Pages (UI Builder)

Gym Membership Management System – reporting and dashboard use case

Submitted by	PRANAV SRINEVAS V	**Register No.**	241401068
Application	Gym_Membership_Management_System (Zoho Creator)	**Department**	B.Tech CSBS

1. Aim

To build report views on top of the gym forms (a list report for each form) and to design a custom dashboard page, **Gym_Dashboard**, with Zoho Creator's UI Builder (Page Builder), giving the administrator an at-a-glance view of members, trainers, revenue, classes, membership status and plan distribution.

This moves the gym from flat registers to visual, role-friendly views so that totals no longer have to be counted by hand.

2. Procedure

Step 1: Design the forms. The six forms of the application were created (Experiment 4).

Step 2: Enter sample data. 30 members were imported from a CSV file; 9 trainers, 30 classes, 31 payments and 24 attendance records were entered.

Step 3: Create the list reports. A list report was created on each form: Trainer_Registration Report, Membership_Plans Report, Member_Registration Report, Class_Schedule Report, Payment_Tracking Report and Attendance_Tracking Report.

Step 4: Open the Page Builder. A page named Gym_Dashboard was created with the UI Builder, which provides elements such as Panel, Board, Chart, Gauge, Report, Snippets, Button and Widgets.

Step 5: Add KPI tiles. Tiles were added for Total Members, Total Trainers, Total Revenue and Total Classes.

Step 6: Add charts. A pie chart of memberships by status (Expired, Pending) and a donut chart of members by plan (Basic, Diamond, Gold, Platinum, Standard) were added.

Step 7: Embed reports. The Member_Registration Report and the Class_Schedule Report were embedded below the charts.

Step 8: Verify. The application was opened in live mode and the reports and dashboard were checked against the data.

3. Output

3.1 List reports

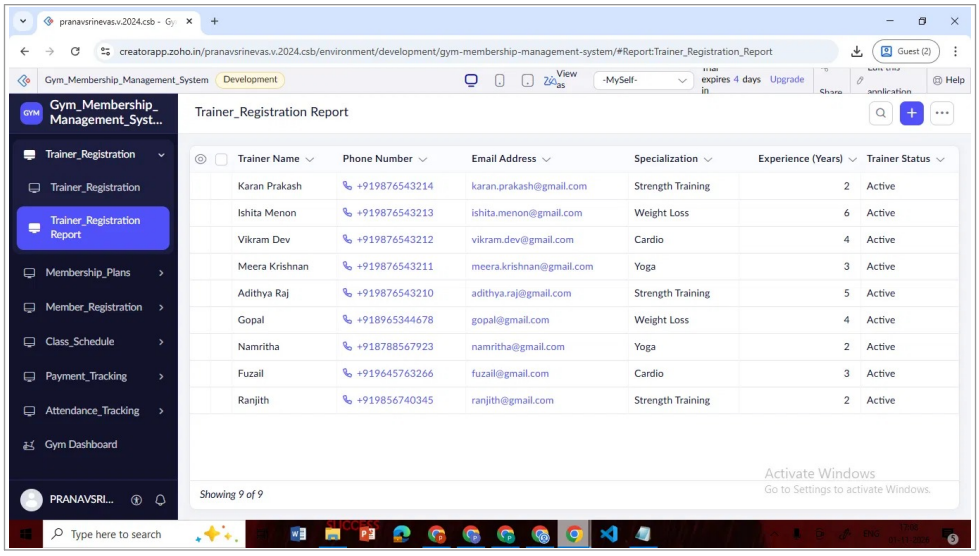

Figure 1: Trainer_Registration Report: 9 of 9 trainers with specialization, experience and status.

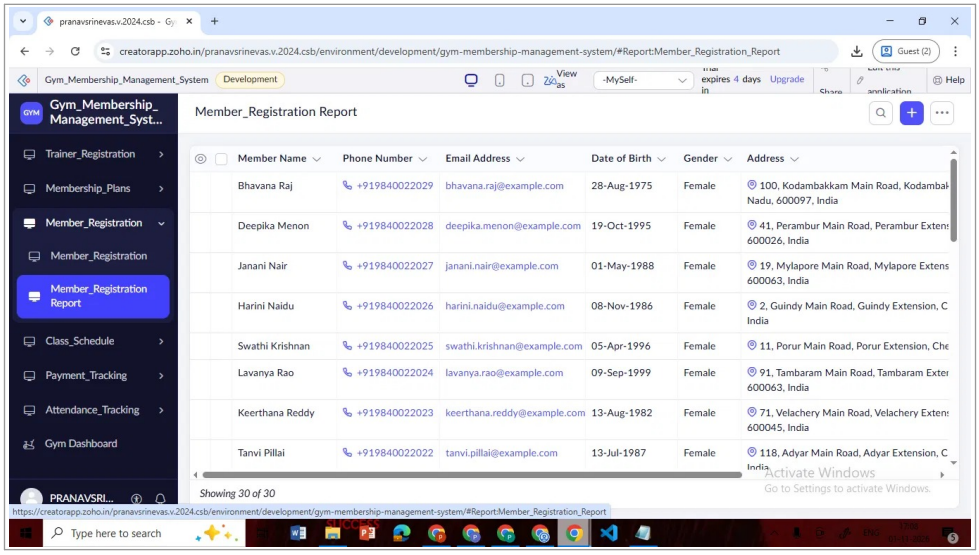

Figure 2: Member_Registration Report: 30 of 30 members with contact details and address.

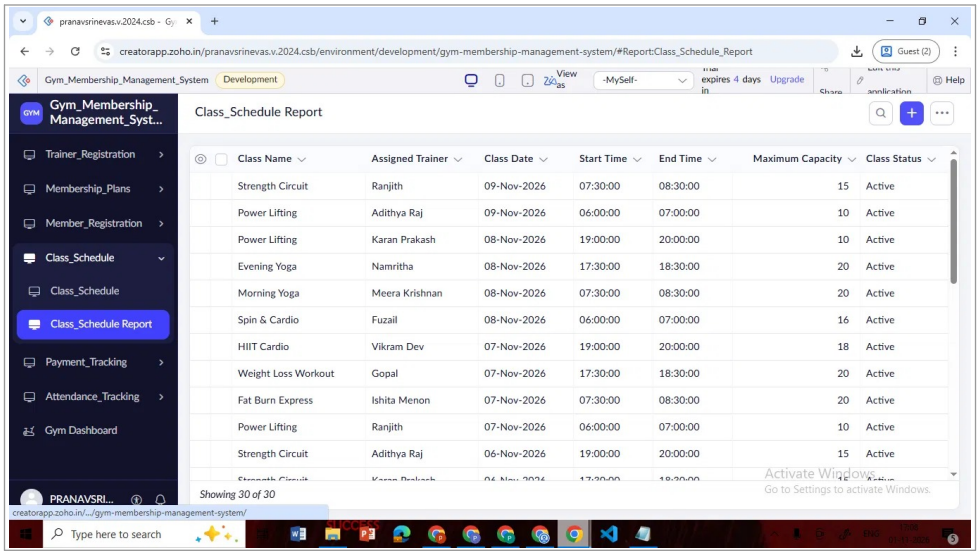

Figure 3: Class_Schedule Report: 30 of 30 classes with trainer, date, times, capacity and status.

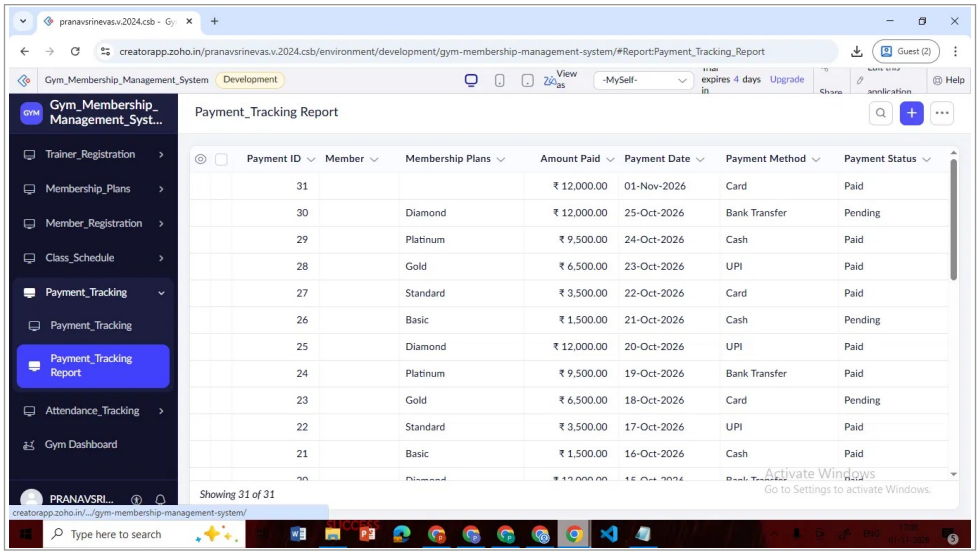

Figure 4: Payment_Tracking Report: 31 of 31 payments with plan, amount, date, method and status.

Figure 5: Attendance_Tracking Report: 24 of 24 attendance records.

3.2 Gym_Dashboard (Page Builder output)

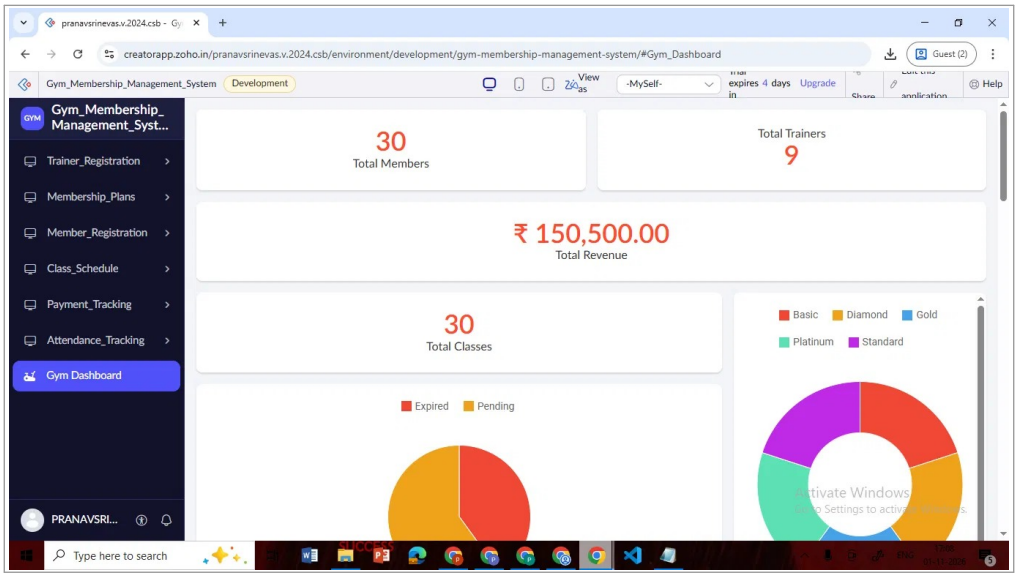

Figure 6: Dashboard top: Total Members 30, Total Trainers 9, Total Revenue ₹150,500.00, Total Classes 30, with the membership-status pie and plan donut charts.

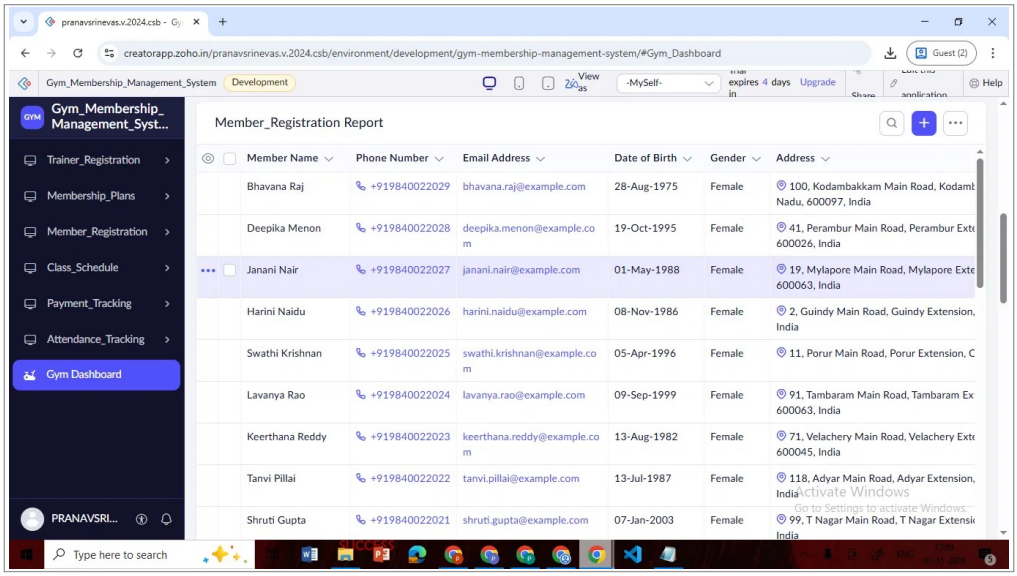

Figure 7: Dashboard: embedded Member_Registration Report.

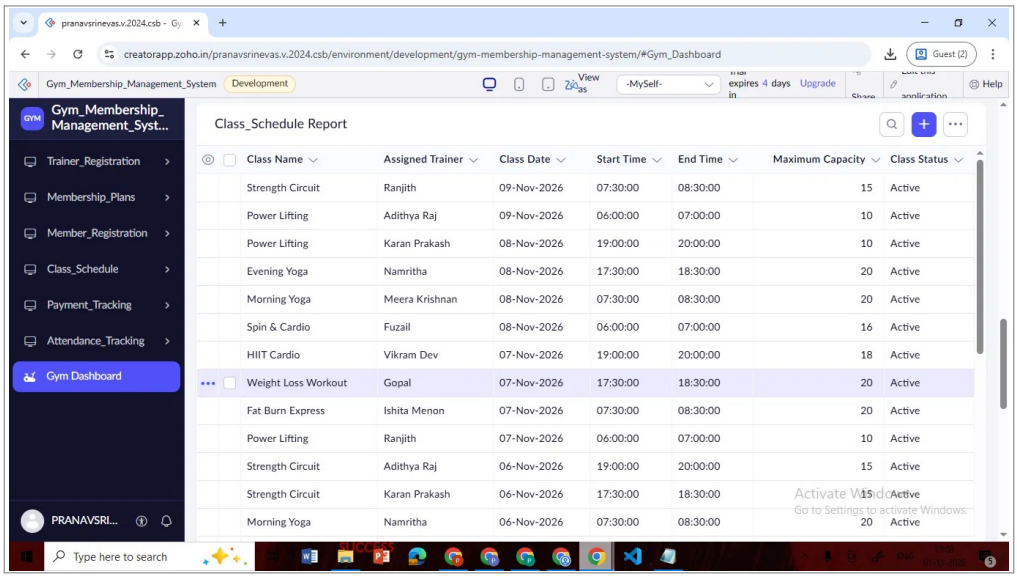

Figure 8: Dashboard: embedded Class_Schedule Report.

3.3 Kanban report

The hospital version of this experiment also used a Kanban report. A Kanban report is **not part of the gym application**; a Kanban board of classes by status or members by plan is listed as a future enhancement. The six list reports and the dashboard meet the reporting objective.

4. Final Result

A list report was built on every gym form and a custom dashboard page was created with the UI Builder. The dashboard combines four KPI tiles, a membership-status pie chart, a plan donut chart and two embedded reports into one view that reads live data from the forms. The exercise showed that complementary low-code views (listed and summarised) can be built without custom code.
