EXPERIMENT 7

Integrating a Zoho Creator Application with Another Zoho Service Using Connections and API

Gym Membership Management System – mail service integration and planned Calendar connection

Submitted by	PRANAV SRINEVAS V	**Register No.**	241401068
Application	Gym_Membership_Management_System (Zoho Creator)	**Department**	B.Tech CSBS

1. Aim

To study the integration of the gym application with other Zoho services. The implemented integration is the **Zoho Creator mail service**, called from a Deluge *sendmail* task in the member-registration workflow. The experiment also describes how a Zoho Calendar connection would be added for the class schedule, as a planned extension.

2. Procedure – implemented integration

1. The form workflow on Member_Registration (Created → Successful form submission) was opened.
2. In the Deluge script, the *sendmail* task was written with *from: zoho.adminuserid* and *to: input.Email_Address*.
3. The subject was built as “Welcome to our Gym, ” + member name, and the message was built with the plan name, plan fee, start date and end date.
4. The task is guarded: it runs only when an e-mail address was entered.
5. A member was registered and the delivered e-mail was checked in Gmail.

3. Output

3.1 Integration summary

Integration	Service / endpoint	Method	Authentication	Purpose
Zoho Creator mail service	Platform mail service (sender shown in Gmail as notifications@t…)	sendmail task in the workflow	Managed by the platform; sent from zoho.adminuserid	Welcome e-mail to the member
Zoho Creator Import Data	Report menu → Import Data	CSV upload with column mapping	Signed-in Creator user	Load 30 members into Member_Registration

3.2 sendmail task used in the workflow

```
sendmail
[
    from: zoho.adminuserid
    to: input.Email_Address
    subject: "Welcome to our Gym, " + input.Member_Name + "!"
    message: "Dear " + input.Member_Name + ",<br><br>"
           + "Thank you for registering with our gym. Your membership details are below:<br><br>"
           + "<b>Membership Plan:</b> " + planName + "<br>"
           + "<b>Plan Fee:</b> Rs. " + planFee + "<br>"
           + "<b>Start Date:</b> " + startText + "<br>"
           + "<b>End Date:</b> " + endText + "<br><br>"
           + "We look forward to seeing you at the gym.<br><br>"
           + "Regards,<br>Gym Management Team"
]
```

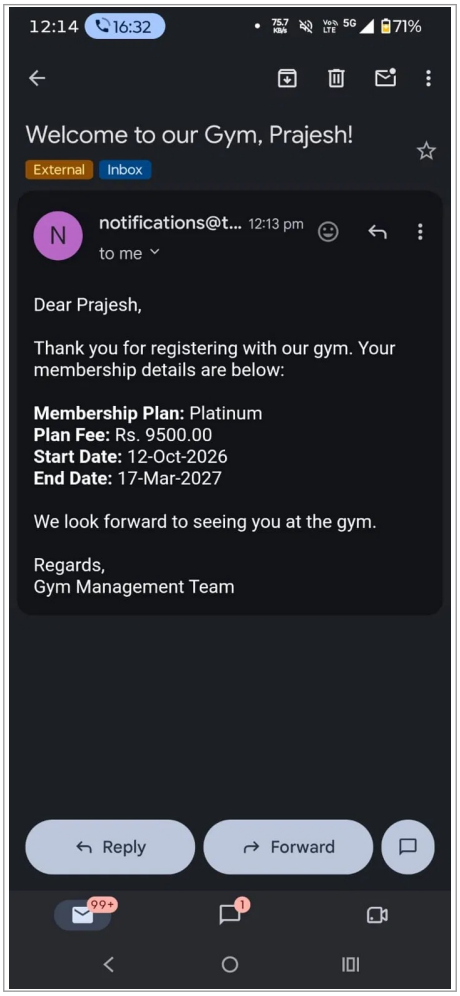

Figure 1: E-mail delivered through the Zoho Creator mail service.

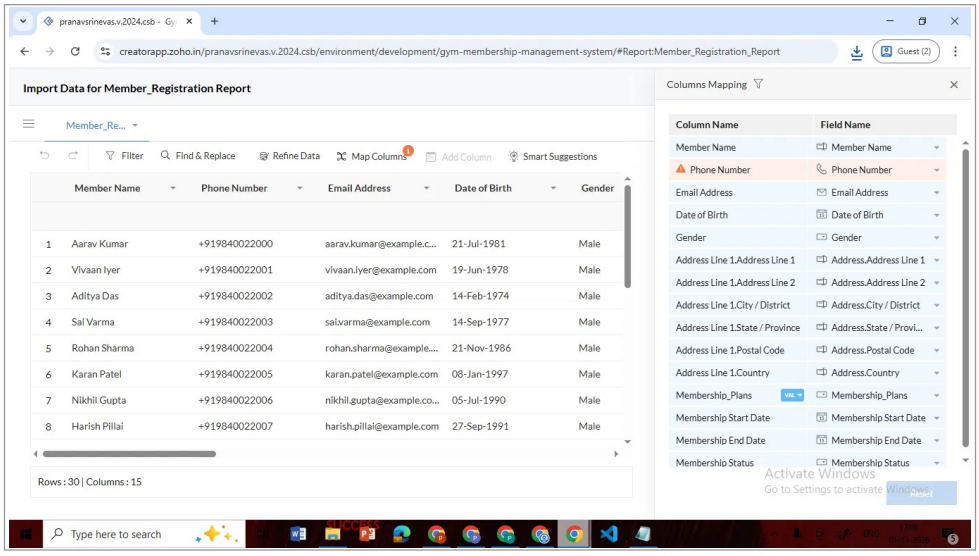

Figure 2: Import Data screen used to load the 30 gym members (15 columns mapped to form fields).

3.3 Planned extension: Zoho Calendar connection (not implemented)

To add each class of Class_Schedule to a Zoho Calendar automatically, the following would be done. This section is a design and was not executed for the gym project.

1. Open Develop → Microservices → Create New → Connections and choose Zoho Calendar.
2. Create a connection (for example *zoho_calendar_connection*) with Administrators-only access and authorise it on the consent screen.
3. Switch the connection on for Gym_Membership_Management_System in Connection Access.
4. Add a workflow on Class_Schedule (Created → Successful form submission) whose Deluge script builds the start time from Class Date and Start Time and calls zoho.calendar.createEvent with the connection link name.

[Screenshot to be inserted]
Insert the connection screenshots here if the Zoho Calendar extension is carried out.

4. Final Result

The gym application is integrated with the Zoho Creator mail service: registering a member automatically sends a personalised welcome e-mail, as the delivered message shows. The CSV import loaded the existing members in one step. A Zoho Calendar connection for class scheduling was designed as an extension but not implemented.
