EXPERIMENT 9

Exploring AI-Assisted Features and Built-In Analytics (Zia) in Zoho Creator

Gym Dashboard, reports and the Zia assistant

Submitted by	PRANAV SRINEVAS V	**Register No.**	241401068
Application	Gym_Membership_Management_System (Zoho Creator)	**Department**	B.Tech CSBS

1. Aim

To explore the built-in analytics and AI-assisted features of Zoho Creator by reviewing the Gym Dashboard (KPI tiles, charts and embedded reports) and the list reports that feed it, and by describing how Zia, the Build Agent, can be used on the gym application.

Objectives

- Review the Gym Dashboard, which combines KPI tiles, two charts and two reports.
- Review the list reports as the source data of the analytics.
- Study how Zia could be used to extend the application and how its output must be checked.

2. Theory

Built-in analytics. Zoho Creator turns form records into summaries without a separate BI tool. A dashboard page can combine KPI tiles, charts and embedded reports; all of them read live data from the forms, so they update when records change.

Zia. Zia is Zoho's AI assistant. In Creator the Build Agent accepts plain-language instructions about forms, reports and dashboards. AI-generated changes must always be reviewed, and an instruction can fail when a requested change cannot be configured.

3. Application specification

Parameter	Detail
Application	Gym_Membership_Management_System
Source data	30 members, 9 trainers, 30 classes, 31 payments, 24 attendance records
Dashboard	Gym_Dashboard: KPI tiles (Total Members, Total Trainers, Total Revenue, Total Classes), membership-status pie chart, plan donut chart, embedded Member_Registration and Class_Schedule reports
List reports	One for each of the six forms

4. Procedure and Output

Step 1: Open the dashboard. The application was opened in live mode and Gym Dashboard was selected. It shows four KPI tiles (30 members, 9 trainers, ₹150,500.00 revenue, 30 classes), the membership-status pie chart and the plan donut chart.

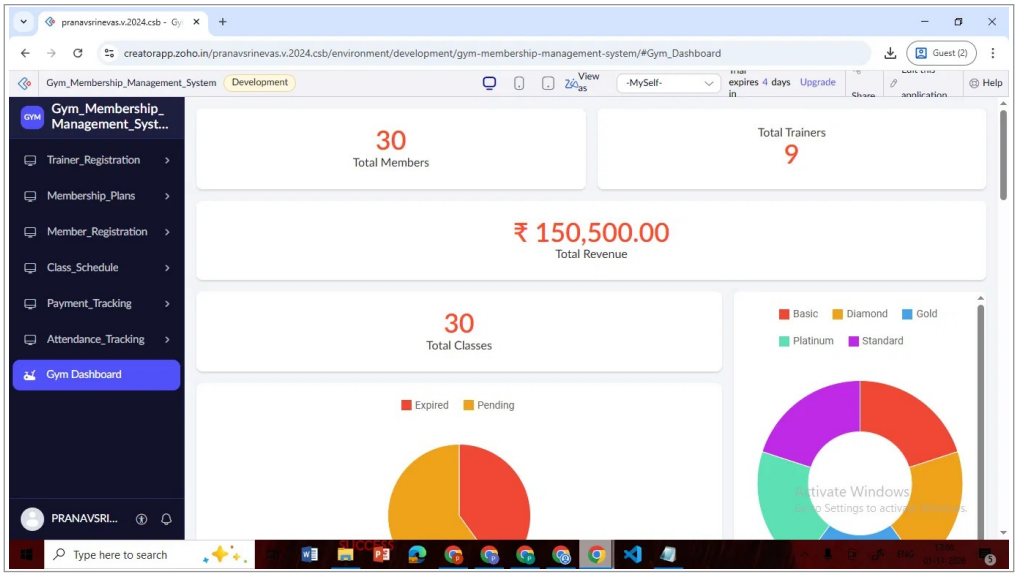

Figure 1: Gym Dashboard – KPI tiles and charts.

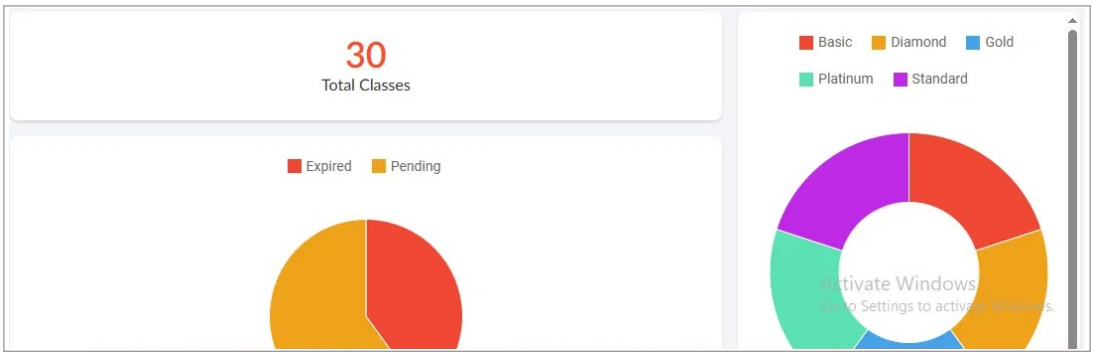

Figure 2: Membership-status pie chart (Expired, Pending) and plan donut chart (Basic, Diamond, Gold, Platinum, Standard).

Step 2: Review the embedded reports. Below the charts the dashboard embeds the Member_Registration Report and the Class_Schedule Report.

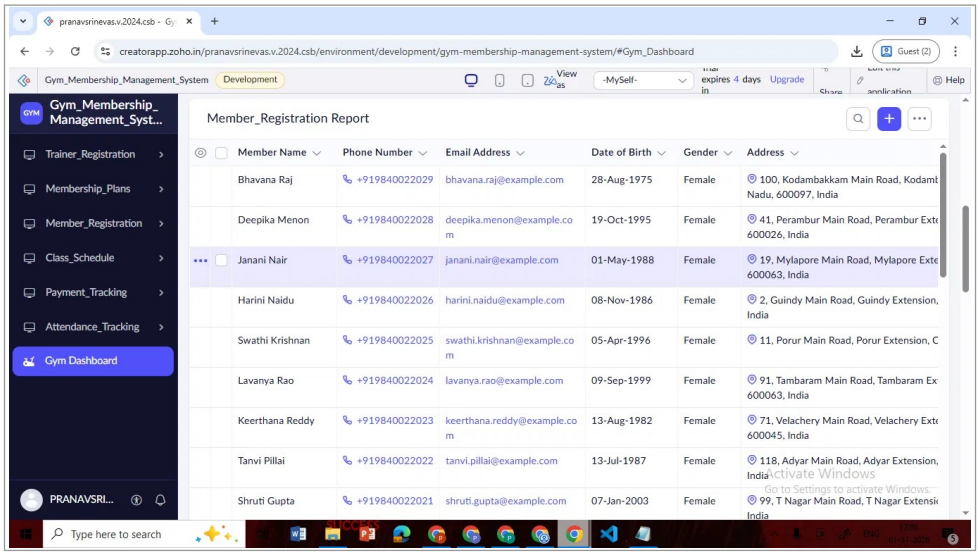

Figure 3: Embedded Member_Registration Report.

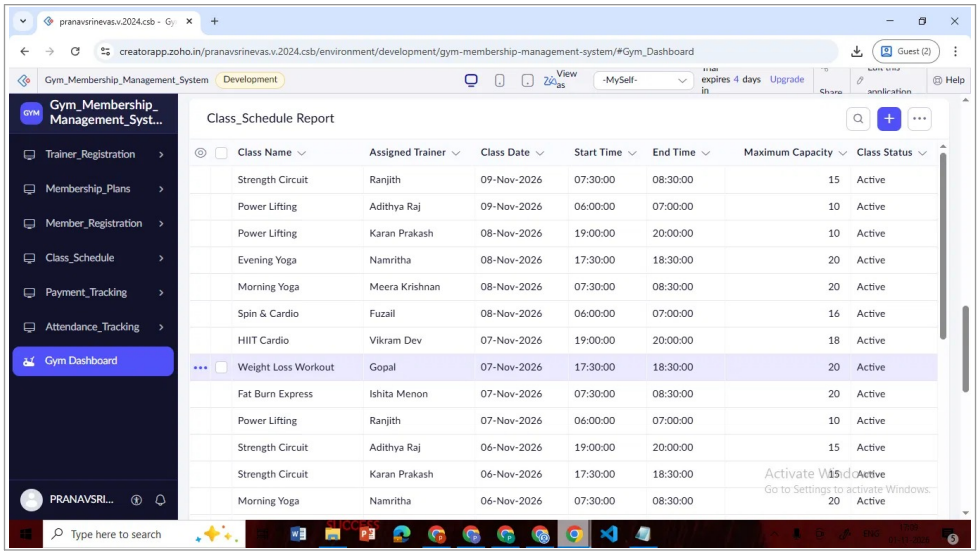

Figure 4: Embedded Class_Schedule Report.

Step 3: Review the source lists. The list reports are the source of every figure on the dashboard, for example the Payment_Tracking Report (31 records) behind the revenue tile.

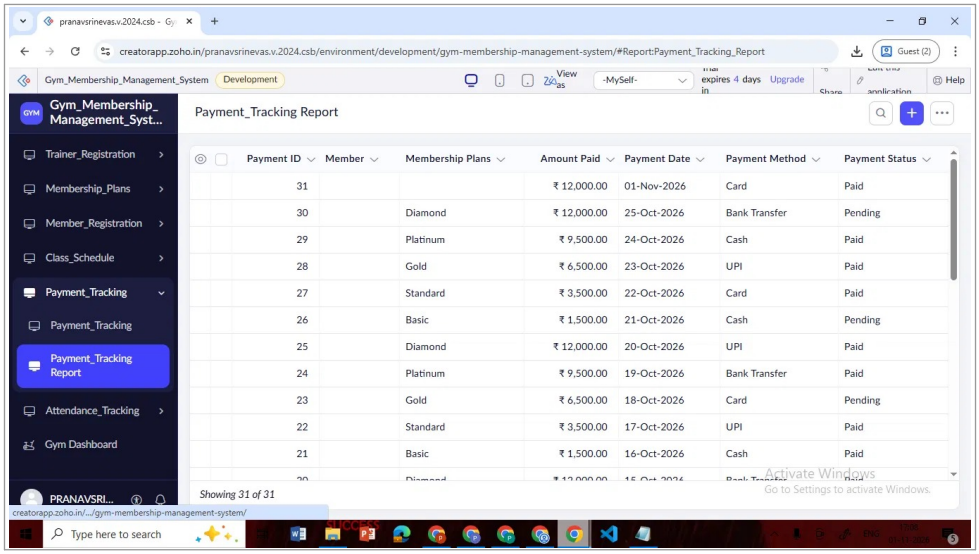

Figure 5: Payment_Tracking Report – source data of the revenue figure.

Step 4: Use Zia (Build Agent). Zia is opened from the Build Agent panel of the builder. Suggested instructions for the gym application are: *"Add a Kanban report of Class_Schedule grouped by Class Status"* and *"Colour the Payment Status column red when it is Pending and green when it is Paid"*. The agent's reply and any error message are to be recorded exactly as shown.

[Screenshot to be inserted]
Insert the Zia Build Agent screenshot (prompt and reply) after trying the instructions in the application.

No Zia result is claimed in this record. Whatever Zia returns must be verified in the report builder, because AI-assisted changes may fail or need manual completion.

5. Observations

- The dashboard combines KPI tiles, charts and live reports on one page without custom code.
- Every figure traces back to a list report, which is the single source of truth.
- The membership-status chart currently shows Expired and Pending members, and the donut chart shows how the five plans are distributed.
- AI-assisted changes need review before they are trusted.

6. Result and Conclusion

The built-in analytics of Zoho Creator turned the gym’s form records into a dashboard of KPI tiles, charts and reports without charting code. Zia can accept plain-language instructions for further changes, but its output has to be verified, and some requests may need manual set-up.
