EXPERIMENT 11

Deploying a Zoho Creator Application from Development to Production

Gym Membership Management System – environments and release process

Submitted by	PRANAV SRINEVAS V	**Register No.**	241401068
Application	Gym_Membership_Management_System (Zoho Creator)	**Department**	B.Tech CSBS

1. Aim

To study how the Gym Membership Management System moves from the Development environment to the Stage environment for review and then to the Production environment, so that only an approved version is live for end users, and to record the current deployment state of the application.

Changes to an application should be reviewed before they reach live users, so an application is promoted through Stage and then published to Production.

2. Deployment model

Zoho Creator provides separate environments. **Development** is where the application is built, **Stage** is a copy used for review and testing, and **Production** is the live copy used by end users. A change is published to one environment at a time, and the application is in maintenance mode while a publish is in progress.

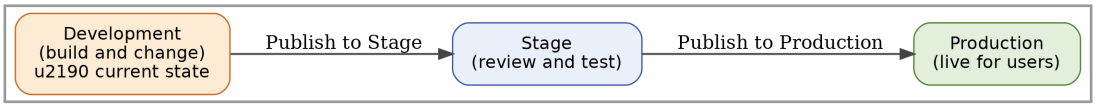

Figure 1: Development → Stage → Production flow; the gym application is currently in Development.

3. Current state of the gym application

The application header shows the **Development** tag beside the application name Gym_Membership_Management_System, the application URL, and the number of days left in the trial. No Stage or Production environment has been created for this trial project.

Figure 2: Application header showing the Development environment.

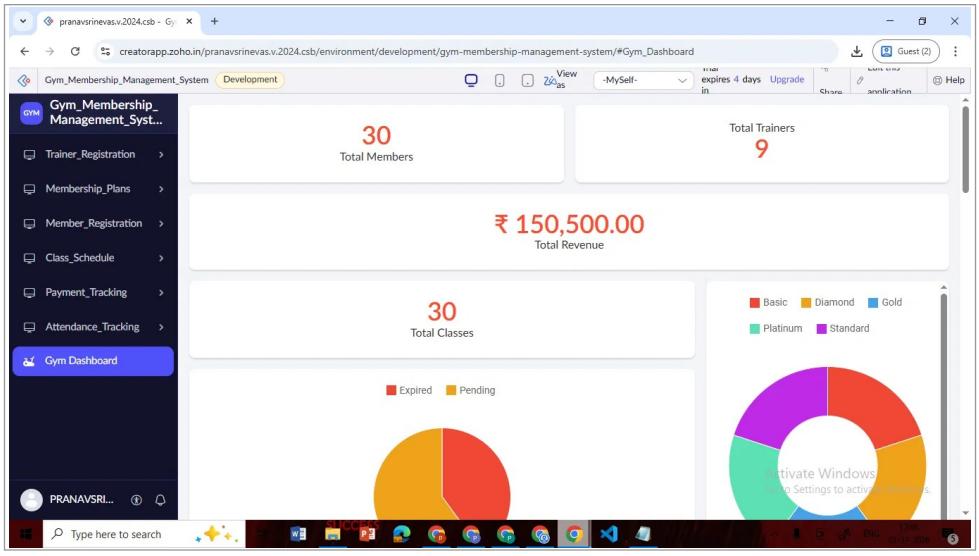

Figure 3: The gym application running in the Development environment.

4. Procedure to deploy (to be carried out in Deploy → Environments)

1. Open Deploy → Environments and choose Add Application; select Gym_Membership_Management_System. Creator creates the development and stage copies and sends a confirmation e-mail.
2. Make a change in Development (for example add a field in the form builder). The Environments page shows the label *Changes available*.
3. Choose Publish → Publish to Stage, select the application and tick the changed components.
4. Enter a title, description, version type (Minor) and a notification e-mail, confirm the version change (for example V1.0 to V1.1) and publish.
5. Check the "Publish to Stage initiated" message and the completion e-mail; Stage should show the new version.
6. Test the application in Stage with sample data.
7. Choose Publish → Publish to Production, select the Stage version and use Publish Now.
8. Refresh the Environments page until Production shows the new version and check the "Publish to Production Completed" e-mail.

[Screenshot to be inserted]
Insert the Environments page, Publish to Stage, Publish to Production and e-mail screenshots after the deployment is carried out.

5. Deployment checklist

S.No.	Checklist item	Status
1	All test cases executed in Development	Done (Experiment 6, report record counts and dashboard figures)
2	Sample data reviewed	Done: 30 members, 9 trainers, 30 classes, 31 payments, 24 attendance records
3	Users configured (Administrator and Trainer)	Done

S.No.	Checklist item	Status
4	Connections authorised	Not applicable: no external connection is used
5	Workflows enabled	Done: one form workflow
6	Stage review and Production publish	Pending: environments not yet created
7	Version and release notes recorded	To be recorded at publish time

Rollback plan. The application can be exported as a backup before any structural change, and the member data can be restored by importing the CSV file again.

6. Result and Conclusion

The multi-stage deployment model of Zoho Creator was studied and the gym application was identified as running in Development in the trial edition. The steps and checklist for promoting it through Stage to Production were prepared; the Stage and Production publishes themselves are to be recorded when carried out. Separating review from live use means that unreviewed changes never reach gym staff and members.
